Yield in twenty-four hours, 24 tons of gray forge iron. Charges--hydrated ore in grains, with--slag from forge, contains about 40 as a mean. Consumption per lb. of iron, i 1-145 at 17 of ash and 3 of u coke l water, or 0916 pure carbon. ores 2-547 flux 0-906 Slag produced. 1-470 This is again an example of economical working, and if we apply to this the methods of calculation above given in detail for Pouzin, we should again find a high value for the ratio CO<sub>2</sub>---. An increase in height would certainly not diminish CO the consumption, already very low. 9 The only possible economy is that which would result from the use of higher temperature of blast. If now I am asked whence arises this great difference between the working of the French furnaces here...
